#### Product : CHARCOAL CEFOPERAZONE DEOXYCHOLATE (CCD) MODIFIED AGAR BASE

Also known as

mCCDA

## Specification

Selective plating medium used for the detection and enumeration of *Campylobacter spp* according to the ISO 10272 standard.

## Formula \* in g/L

Meat extract	10,00
Peptone	
Sodium chloride	
Bacteriological charcoal	
Casein hidrolysate	
Sodium deoxycholate	
Iron (II) sulfate	
Sodium pyruvate	
Agar	

Final pH 7,4 ± 0,2 at 25 °C

\* Adjusted and /or supplemented as required to meet performance criteria

#### **Directions**

Suspend 24.2 g of powder in 500 mL of distilled water and bring to the boil to dissolve. Sterilize in an autoclave at 121°C for 15 minutes. Cool to 47-50°C and aseptically add one vial of the Campylobacter CCDA Selective Supplement (Art. No. DSHB3110). Mix carefully and pour into sterile Petri dishes.

Note: If the plates are prepared in advance, they should be kept for not more than 4 hours at ambient temperature or for no more than 7 days in the dark at  $3 \pm 2^{\circ}$ C.

## Description

CCD Modified Agar is formulated according to the ISO Standard 10272-1:2006 and is intended to detect and enumerate *Campylobacter spp* from food and animal feeding stuffs.

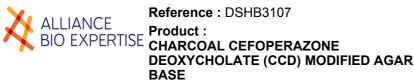

After determining that *Campylobacter* species grow best on solidified Nutrient Broth No. 2 compared to other media workers (1983) carried out a systematic survey of alternatives to blood for neutralizing oxygen toxicity. A combination of 0,4% charcoal, 0,25% ferrous sulfate and 0,25% sodium pyruvate proved best.

A further study surveyed the suppressive effect of several inhibitors on the undesirable microbiota showing deoxycholate and cefazolin as the most effective inhibitory agents. Later, in 1984, Hutchinson and Bolton replaced cefazolin (10 mg/L) with cefoperazone (32 mg/L). This allowed fewer contaminants to grow, and permitted the modified medium (modified CCD Agar or mCCDA) to be used at 37°C. However amphotericin B was needed to prevent overgrowth by yeast able to grow at 37°C but not at 41,5  $\pm$  1°C.

In 1993 Aspinall *et al.* developed a modification of mCCDA designed for use at 37°C to isolate *C. upsaliensis* as well as the other thermophilic *campylobacter* species. This medium contains 8 mg/L cefoperazone and 4 mg/L teicoplanin replacing 32 mg/L cefoperazone in mCCDA. Teicoplanin has an antimicrobial spectrum similar to that of vancomycin, active mainly against Gram positive bacteria. By comparison with mCCDA the final formulation of this medium, called CAT Agar, isolated the same numbers of *Campylobacter spp* other than *C. upsaliensis* from faeces and is superior to mCCDA for *C. upsaliensis* with slightly higher growth of competing microflora.

## Necessary supplements

Distilled water (Solvent)

#### Technique

Immediately before use, carefully dry the agar plates, preferably with the lids off and the agar surface downwards, in a drying cabinet, until the agar surface is free of visible Humidité (maximum 30 minutes).

Using the culture obtained from enrichment broth (Bolton Broth), inoculate the mCCDA with a sterile loop. Incubate plates à 41,5°C in a microaerobic atmosphere (approximately 5% O2, 10% CO2 and 85% N2 or H2), for 44 ± 4 hours.

- Campylobacter jejuni strains produce grey, moist flat and occasionally spreading growth which may be accompanied with a green hue and/or a metallic sheen.

- Campylobacter coli strains tend to be creamy-grey in colour, moist and often produce a more discrete type of colony.

- Campylobacter lari strains are more varied and produce both types of colonial morphology.

- Occasionally contaminating organisms may grow on this medium. These include cefoperazone-resistant Pseudomonas spp, Enterobacteriaceae, and some streptococci and yeasts.

## Quality control

Incubation temperature: 41,5 ± 1°C

Campylobacter jejuni ATCC<sup>®</sup> 29428

Staphylococcus aureus ATCC<sup>®</sup> 25923

Campylobacter coli ATCC<sup>®</sup> 43478

Escherichia coli ATCC<sup>®</sup> 8739

Incubation time: 44 ± 4h

**Inoculum:** Practical range 100 ± 20 CFU. Min. 50 CFU (productivity) / 10<sup>4</sup>-10<sup>6</sup> CFU (selectivity) according to ISO 11133:2014/Amd 1:2018 .

## Microorganism

**Growth** Productivity > 0.50 Productivity > 0.50

Partial Inhibition

Total inhibition

## Remarks Under microaerophilic atmosphere Under microaerophilic atmosphere

### Storage

For laboratory use only. Keep tightly closed, away from bright light, in a cool dry place (+4 °C to 30 °C).
